

Lanternfishes (Myctophidae) collected by the German research vessel *Walther Herwig* in the Exclusive Economic Zones of Argentina and Uruguay.

Stefan Koerber

Independent researcher. Friesenstr. 11, 45476 Muelheim, Germany. pecescrillos@koerber-germany.de

Abstract

The German research vessel *Walther Herwig* has conducted five expeditions to the Southwestern Atlantic Ocean between 1966 and 1981. During these cruises several dozens of stations were sampled within the Exclusive Economic Zones of Argentina and Uruguay, and thousands of myctophid specimens have been collected and later been deposited in the collection today housed at the Zoological Museum of Hamburg. These collection lots, mostly determined by the myctophid specialist Alexander Hulley or under his guidance, today represent the best available source to evaluate the status of myctophid species already included, or not, in the national lists of marine fishes from those countries. Based on specimens 29 myctophid species are confirmed for Argentina and 41 for Uruguay, including 8 and 19 first records. Remarks and conclusions on the status of the waters surrounding the Malvinas/Falkland Islands and the resulting consequences for the implementation of conservation measures are specified.

Resumen

El buque de investigación alemán *Walther Herwig* ha realizado cinco expediciones al Océano Atlántico Sudoeste entre 1966 y 1981. Durante estos viajes varias docenas de localidades dentro de las Zonas Económicas Exclusivas de Argentina y Uruguay fueron muestreadas, y miles de especímenes de myctófidos fueron colectados y posteriormente depositados en la colección que hoy se encuentra en el Museo de Zoología de Hamburgo. Estos lotes de colección, en la mayoría de los casos determinados por el especialista en myctófidos Alexander Hulley o bajo su conducción, hoy día representan la mejor fuente disponible para evaluar el estado de las especies myctófidos ya incluidos, o no, en las listas nacionales de peces marinos de aquellos países. Basado en especímenes se confirman 29 especies de myctófidos para Argentina y 41 para Uruguay, incluyendo 8 y 19 primeros registros. Se especifican comentarios y conclusiones sobre el estado de las aguas que rodean las Islas Malvinas/Falklands y las consecuencias resultantes para la implementación de medidas de conservación.

Introduction

Myctophids comprise over 250 species within 34 genera. They are distributed in all oceans and typically occupy a large vertical range from the surface to mesopelagic depths of 200 to 1.000 m. Lanternfishes (Myctophidae) and blackchins (Neoscopelidae) are the two families that compose the order of Myctophiformes, representing 65% of the deep-sea fish biomass and 20% of the overall marine ichthyofaunal biomass. During the nocturnal vertical migration towards the upper layers of the oceans both, the quantity of individuals and the density of the shoals can be so high that during the second World War the then recently developed sonar technology did indicate a false sea floor at daytime. During the 1971 expedition of the *Walther Herwig* a single haul yielded 15 tonnes of *Diaphus dumerili* off Patagonia.

Laternfishes have been given their common name because of their ability of emitting light from luminescent non-bacterial photophores arranged laterally and ventrally along the body (fig. 1). This illumination plays a roll in three different traits of the myctophids' life: 1) There may still be enough rest of sunlight reaching the oceans' twilight zones that predators could recognize the silhouette of potential prey from below. In this situation emitting a ventro-lateral counterillumination is a highly efficient camouflage strategy. 2) Members of the genus *Diaphus* possess head photophores next to their eyes which function as searchlights to find prey. 3) The quantity and arrangement of photophores are typical for each species, in some even show a

sexually dimorphism. This specific arrangement may help to unambiguously identify potential sexual partners from the own species.

If the myctophid photopores help to find food, not to become food, and to find a mate, then it is striking that a single morphological function supports the ultimate individual target in evolution: Survive long enough to leave a legacy in your populations's genepool.

Beyond the upper edge of the continental slope myctophids are an important source of food for seals, whales, squids, and bigger fishes. In the Southwest Atlantic Ocean their role in the trophic system is well investigated for the Scotia Sea, but for the EEZ-AR and EEZ-UY further north the only available source is the information on stomach contents in *Merluccius* hake (Angelescu & Cousseau 1969). Unfortunately there is no published information on deposited voucher specimens from this investigation available.

Her work was published in *Poissons provenant des campagnes du yacht Princesse-Alice*. Image and legend retrieved from Wikimedia Commons.

Strictness in precise localities

All kinds of conservation measures require jurisdictional range and thus, national species lists must be reduced to confirmed findings from within the current political borders of the respective country, including its maritime limits. Beyond a country's own jurisdictional range the monitoring of a species' status is difficult and a consistent implementation of management plans for threatened species is nearly impossible.

The inclusion of records from international waters or from neighbor countries' *Exclusive Economic Zones*, as well as the special case of the *Common Fishing Zone of Argentina and Uruguay* have been recently addressed by Koerber (2023). Another aspect to be considered is the maritime zone surrounding the Malvinas/Falkland Islands. Although by Argentina considered to be part of its own territory, as a matter of fact this area today is beyond the range of Argentina's jurisdiction.

In the present contribution this zone is entitled *Fisheries Conservation Zone of the Falklands Islands*, herein encoded FCZ-FK, compound of the interim and outer zones, FICZ and FOCZ, and for two reasons treated as separate from the EEZ-AR:

In a first place the structure of the ZMH collection database is being maintained. Within the respective ZHM dataset in column 'country' the entries follow the 2-letter-code defined in ISO 3166, in which for areas as Malvinas/Falkland or South Georgia & South Sandwich Islands individual codes as FK and GS are available and those territories are not included under AR, nor under GB. Nevertheless, several collection sites located on the Burdwood Bank have been corrected from FK to AR. The collections of the *Walther Herwig* in the Southwest Atlantic Ocean started in 1966, even before Argentina had defined its maritime limits as we know them today and long before the declaration of the FCZ-FK. These historical changes may have caused the detected inconsistencies in that dataset.

The second reason is that the beginning of this dispute dates back to 1833 without having been solved yet. But conservation of biodiversity cannot wait for another century, not even for decades or only years. Thus, while for this area the current *status quo* persists, the responsibilities and obligations arising from the *Convention on Biological Diversity* (CBD) are to be taken by e.g. the Administration of the British Overseas Territories and, in consequence, for the time being separated species lists for EEZ-AR and FCZ-FK are more constructive as correct national faunal lists are a first necessary step towards a successful monitoring and management of biodiversity.

This provisional practice of separating biodiversity inventories for mere conservation purposes shall by no means be understood as a statement against the claim of Argentina to gain sovereignty over the Malvinas/Falkland Islands.

Strictness in evidence-based records

In natural sciences results must be reproducible. There should be no space for assumptions on e.g. applied standards or experimental setups. Although it has become a broadly accepted standard to deliver this information in the methods' section of taxonomic works, this practice usually is set aside in biological inventories. In many cases the authors provide no references at all about their sources, in others the references lead to further works without information that would allow reproducibility by naming the voucher specimen deposited in a collection and thus, enable later researchers to examine and eventually redetermine specimens.

A suitable example for the confusion that can be generated by references missing voucher specimens is the case of *Peprilus paru*. This species has been indicated for Argentina and Uruguay since the work of Berg (1895) and ever since been repeated in subsequent works from these countries. In 2011 Marzeniuk et al. revalidated both, *Peprilus crenulatus* and *Seserinus xanthurus*, from the synonymy with *Peprilus paru* and concluded that the real *P. paru* is distributed in the Caribbean and the Gulf of Mexico, while the two revalidated taxa are sympatric off Uruguay and Argentina. As no voucher specimens are known for most mentions of '*P. paru*' made between 1895 (Berg) and current times (Nion 2016; Cousseau & Rosso 2019) an assignment of these records to either of the two revalidated species is arbitrary.

As a result of a thorough taxonomic revision such a situation may occur in any group of organisms and in consequence all records not based on voucher specimens may be treated as doubtful for a specific area.

Only for organisms too large for being transported or preserved in collections, photo evidence may be acceptable to replace voucher specimens. This may be the case for big sharks, rays, or molid species, provided that the photos show the characters necessary to identify the respective species undoubtfully.

Available myctophid voucher material

Under the expectation of the above mentioned double strictness regarding localities and reproducibility, the inclusions of myctophids from Argentina and Uruguay in the respective most recent national lists are inadequately justified or not traceable at all. Mabragaña & Cousseau (2021) mentioned 38 myctophid species for Argentina, for which the chains of provided references in only three cases lead to published voucher specimens from the EEZ-AR (table 1, figs. 2, 3). Nion et al (2016) did not provide any references in their list of 36 myctophid species from Uruguay and hence, for this country's EEZ there is no possible reproducibility whatever. Only for two species, *Diaphus meadi* and *Protomyctophum choriodon*, reproducibility could not be better (see 'criteria' below) as type specimens have been obtained in the EEZ-UY. Nevertheless, the Uruguayan distribution of *D. meadi* had been overlooked by Nion et al. 2016 (Koerber 2023).

In difference to national inventories which cover a vast diversity of marine fishes, more detailed information could be expected from topical works on taxonomic groups. For myctophids from the Atlantic the best available source is still to be found in the contribution of Hulley (1981) and for the circumglobal southern myctophids in the thesis of McGinnis (1974), later made available in a published work (1982).

Hulley's monograph was based on 129.433 myctophid specimens collected by the *Walther Herwig* in the Atlantic during several cruises conducted between 1966 and 1976. Dozens of the respective *Walther Herwig* stations are located within EEZ-AR, EEZ-UY, and FCZ-FK (table 2). The mere quantity of specimens unfortunately did not allow to include a list of examined material in Hulley (1981) and, due to the restricted available space at the ISH collection, also lead a dispersion of specimens to other collections as e.g. AMS, NHMD, USNM, and ZMUC. All specimens collected during the cruises from 1966 to 1971 have been first determined by Krefft and in 1973 were redetermined by Hulley (Hulley, pers.comm.). Anyhow, the determiner of each collection lot mentioned in the below species accounts is maintained as indicated in the ZMH dataset.

The collection of fishes housed at ISH has been transferred to ZMH in 1993, when ISH moved from Hamburg to Bremen to become part of the Thünen Institute. With 4.838 collection lots the Myctophidae now is the best represented family of Actinopterygii in the ZMH collection (Thiel et al. 2009).

For his work on the myctophids from South of 30°S, McGinnis (1974, 1982) has examined specimens collected by the research vessels *Eltanin*, *Discovery*, and *William Scoresby*. For the included species he has provided the stations where these had been collected (table 3), but, unfortunately and just as Hulley, not the collection lots of voucher specimens. Therefor the accounts from McGinnis are all included only under the third category of 'localities'. Anyhow, the researches of these three vessels are so well documented that the specimens examined by McGinnis are most probably still available in the respective collections and future reexamination of these lots could lead to confirmations of some species listed below as yet unconfirmed for EEZ-AR and/or EEZ-UY.

From all species included in the below accounts, *Lampanyctus wisneri* (Zahuranec, 2000) is the only one described after the publication of Hulley (1981). For two lots of non-type specimens from the EEZ-AR the very author of the species, Zahuranec, is given as the determiner, indicating that he has examined myctophids at the ZMH collection. In reverse conclusion it can be assumed that the determinations of all other lots listed below are still valid from the determinations of Hulley and/or staff of ISH.

In addition to the already mentioned vessels myctophids have been reported from some cruises of Soviet vessels, but all these are located within the FCZ-FK (table 3, figs. 10, 11) and the respective specimens are probably still available in Russian collections.

Conclusion & outlook

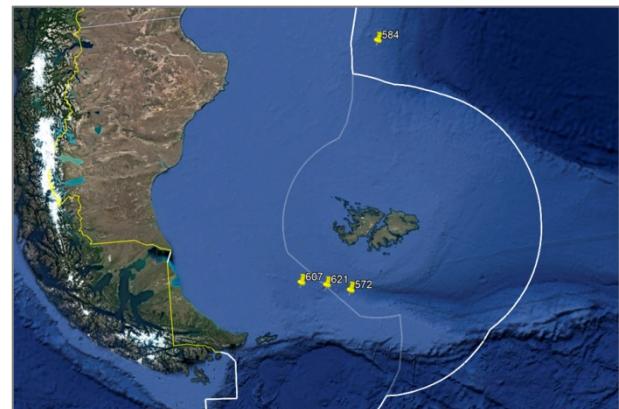

The so far described circumstances regarding myctophids from off Argentina and Uruguay can be summarized as follows:

- o The most recent national lists on marine fishes of Argentina and Uruguay, with the exception of only three cases for Argentina, do not allow reproducibility regarding exact localities within the respective EEZ, nor regarding known voucher specimens available for redetermination.
- o No other research vessel has conducted so many collections of myctophid specimens from so many stations within the maritime boundaries of Argentina, Uruguay, and the Malvinas/Falkland Islands as the *Walther Herwig* did.
- o No other collection houses more myctophid specimens from this area than ZMH with the advantage that these have all been determined or redetermined by specialists on myctophids as e.g. Hulley and Zahuranec.

Considering these combined aspects, the collection of myctophids done by the *Walther Herwig* should be seen as the currently best available source and the below species accounts be treated as the best opportunity for a new zero-line for future inclusions of myctophids in the biodiversity inventories of Argentina and Uruguay. There are probably hundreds of so far unpublished voucher specimens deposited in the collections around the globe still awaiting to become part of new research results and with the present contribution we have hopefully not heard the last word in this issue. Any correction of or addition to the present list will help to improve our knowledge on the species of Myctophidae and to better justify inclusions in national inventories of biodiversity or, in case of differing redetermination, prove a below included account to be erroneous and eventually remove a species from such a list.

figs. 10, 11 Collection localities of myctophid specimens by foreign vessels from table 3 (without *Atlantis II* 1441 in EEZ-UY).

Methods

Each species is listed under the currently valid name, followed by a list of synonyms which includes the original combination used in the description (Fricke et al. 2024).

For each species the general distribution is given as indicated by Hulley (1981) and Fricke et al. (2024). Then for each area (EEZ-AR, EEZ-UY, and FCZ-FK) all so far known references are provided, followed by the *Walther Herwig* specimens from an area, as well as a final comment on the status of this species for the respective area. For each lot of specimens the collection number, the *Walther Herwig* station where the specimens have been collected, and the determiner are provided. Voucher specimens or localities from international waters have only been included if treated as source other authors have referred to. To visually separate these clearly from the occurrences within national areas, such international accounts have been put in grey writing in order to express the minor importance.

If available, vernacular names have been taken from Fishbase. Common names set in brackets are being proposed herein.

During the preparation of this contribution the focus has been clearly on the Exclusive Economic Zones of Argentina and Uruguay and as much literature as possible from or about these countries has been obtained and checked. There is no doubt that for the FCZ-FK a lot of literature has not been considered yet, especially difficult to obtain technical reports. Hence, all results for the FCZ-FK are rather tentative side-products, still worth to be mentioned in the current context.

Collection acronyms & abbreviations

- AMS Australian Museum, Sydney
- APF Antarctic Polar Front
- CBD Convention on Biological Diversity
- EEZ-AR Exclusive Economic Zone of Argentina
- EEZ-CL Exclusive Economic Zone of Chile
- EEZ-UY Exclusive Economic Zone of Uruguay
- FCZ-FK Fisheries Conservation Zone of Malvinas/Falkland Islands
- FSFL now FSFRL, National Research Institute of Far Seas Fisheries, Shimizu, Japan
- INIDEP Instituto Nacional de Investigación y Desarrollo Pesquero, Mar del Plata, Argentina
- ISH Institut für Seefischerei, Hamburg. Collection now at ZMH↑
- N North
- NHMD Natural History Museum of Denmark, Copenhagen
- S South

- W West
- WH *Walther Herwig*, former German research vessel
- ZIN Zoological Institute, St. Petersburg, Russia
- ZMH Zoological Museum of Hamburg, Germany
- ZMUC Zoological Museum, University of Copenhagen, Denmark. Now NHMD↑

Criteria for published records in descending grade of reliability

- type localities Published records of holotypes, paratypes or any other kind of type specimens of either the nominal species or a synonym collected in the respective maritime territory.
- non-type specimens Records of either the nominal species or a synonym collected in the respective area which have been published including a collection number of voucher specimens.
- localities Records of either the nominal species or a synonym collected in the respective area which have been published providing details on the locality of collection, but without including a collection number of voucher specimens.
- mere listings Published mentions, e.g. in faunal lists, of either the nominal species or a synonym for the respective area without providing details as the locality of collection and a collection number of voucher specimens.
- miscellaenea Published statements or opinions that a species is not to be found in a respective area or general statements on the distribution of a species in the SW Atlantic Ocean without further details.

Table 4. Occurrence of Myctophidae in the treated areas. Type specimens marked with red circles, non-type specimens in green, and records as localities or mere mentions, both not corroborated by specimens, in white. Stars indicate first records for Argentina or Uruguay presented herein.

MYCTOPHIFORMES

family

Myctophidae

subfamily

Gymnoscopelinae

Gymnoscopelus Günther, 1873**G. bolini** Andriashev, 1962

Grand lanternfish

Gymnoscopelus bolini Andriashev, 1962EEZ-AR references

general statements on the distribution of this species:

- Hulley (1981): ...circumglobal distribution between the Subtropical Convergence and the Antarctic Convergence ... in the South Atlantic west of 07°30'W between about 40°S and 58°S, although west of 40°W its northern limit lies at about 36°S.
- Fricke et al. (2024): southern circumglobal

localities in EEZ-AR:

- Stehmann & Schulze (1996): *Walther Herwig* 340/71, 693/78

mere listings for Argentina:

- Menni et al. (1984): ref. to Angelescu & Cousseau (1969)
- Chebez & Padilla (1999)
- Cousseau & Rosso (2019)
- Cousseau et al. (2020): ref. to Gon & Heemstra [> Hulley 1990] and Figueroa et al. (1998)
- Mabragaña & Cousseau (2021): ref. to Cousseau et al. (2020)

non-type specimens from international waters:

- Cousseau et al. (2012): INIDEP 584, 46°53'S 59°54'W

miscellanea:

- Angelescu & Cousseau (1969): stomach content of *Merluccius hubbsi*, no distinct locality, no mentioned voucher specimens
- Hulley (1990): Generally, between APF and STC, with northern extension to about 38° S off Argentina, to 40°S off Chile...

	specimens	○ none
	status	While still lacking a published evidence-based record, a distribution of this species in EEZ-UY should not be implied.

P. parallelum (Lönnberg, 1905)*Myctophum parallelum* Lönnberg, 1905

Parallel lanternfish

references

general statements on the distribution of this species:

- Hulley (1981): ...has been reported from the western South Atlantic ... circumglobally distributed between the Subtropical Convergence and the Antarctic Convergence...
- Fricke et al. (2024): Southern circumglobal

EEZ-ARreferences

localities in EEZ-AR:

- McGinnis (1974, 1982): *Eltanin* 125, 1503

specimens

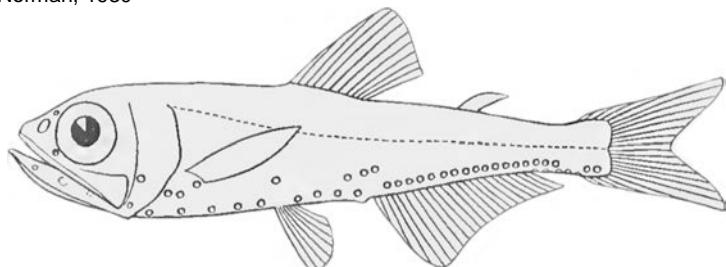

- none

status

While still lacking a published evidence-based record, a distribution of this species in EEZ-AR should not be implied.

P. tenisoni (Norman, 1930)*Myctophum tenisoni* Norman, 1930

Tenison's lanternfish

Myctophum tenisoni Norman, 1930
Drawing from original description.references

general statements on the distribution of this species:

- Hulley (1981): *Walther Herwig* data reveal that although *P. tenisoni* can be found as far north as 38°20'S, 54°33'W [EEZ-AR], its northern limit in the western South Atlantic generally lies between 45°S and 46°S. The species was recorded as far south as 59°51'S ... a broadly antarctic species...
- Fricke et al. (2024): southern circumglobal

remarksWhere specimens are available, a re-determination of the below listed records will possibly result in *P. luciferum*.EEZ-ARreferences

localities in EEZ-AR:

- McGinnis (1974): *Eltanin* 348, 1503

Acknowledgements

Thanks are due to Alexander ‘Butch’ Hulley (Iziko South African Museum, Cape Town) for improving an earlier version of the manuscript and providing valuable first-hand comments on the collection of myctophids by the *Walther Herwig*. To Ralf Thiel (former curator of the ichthyological collection at ZMH) for providing details about the collection lots under his care. Very special thanks are due to Cristina Garilao (Leibniz Institute for the Analysis of Biodiversity Change, Hamburg) for her valuable support to match former collection lots of ISH with current ZMH numbers. Ronald Fricke (Eschmeyer’s Catalog of Fishes, Staatliches Museum für Naturkunde, Stuttgart) has readily shared literature. Tomasz Linkowski (National Marine Fisheries Research Institute, Poland), Timo Moritz (Deutsches Meeresmuseum, Stralsund), Griselda Lambertini, and Ron Fricke have provided valuable comments on a late version of the manuscript. GoogleEarth has made available the satellite images used herein.
